

AEM Experience Fragments

Complete Guide — Chat Summary

Adobe Experience Manager 6.5

Q: How to create an Experience Fragment?

A: Experience Fragments in AEM (General Overview)

An **Experience Fragment** is a group of one or more components (including content and layout) that can be referenced within pages or across channels.

Steps to Create an Experience Fragment

1. Navigate to Experience Fragments

Go to AEM Start → Experience Fragments (or via Tools > Assets > Experience Fragments).

2. Create a new fragment

Click **Create** → **Experience Fragment**. Select a template (e.g. Web variation, Email, etc.). Fill in Title, Name (auto-generated), and optional Tags.

3. Edit the fragment

Open the newly created fragment. Use the component editor to add components (text, image, teaser, etc.). Edit content just like a regular AEM page.

4. Create variations (optional)

Inside the fragment, click **Create Variation** to make channel-specific versions (e.g. email or social).

5. Publish the fragment

Click **Publish** (or Manage Publication for scheduled publishing). The fragment must be published before it can be used on live pages.

6. Use it on a page

On any AEM page, drag the **Experience Fragment component** into a parsys, browse and select your fragment.

Key Tips

- Fragments live under /content/experience-fragments/ in the JCR.
 - You can export fragments to Adobe Target as offers for personalization.
 - Use building blocks inside fragments for reusable sub-components.
 - Fragments support Live Copy for multi-site management.
-

Q: Guide correctly — mine is AEM 6.5

A: Creating an Experience Fragment in AEM 6.5

Prerequisites

- Author access to AEM 6.5
- Experience Fragments template enabled in Template Editor

Step-by-Step Guide

Step 1 — Go to Experience Fragments Console

From AEM home, click **Experience Fragments**, or navigate to:

```
http://<host>:<port>/aem/experience-fragments.html
```

Step 2 — Create a Folder (optional but recommended)

Click **Create** → **Folder**. Give it a name to organize fragments by brand, region, or project.

Step 3 — Create the Experience Fragment

Click **Create** → **Experience Fragment**. On the template selection screen, choose:

- **Experience Fragment Web Variation** (most common)
- Custom templates if configured by your team

Fill in the details:

- **Title** — required
- **Name** — auto-filled, used in the path
- **Description** — optional
- **Tags** — optional

Click **Create**, then **Open** to start editing.

Step 4 — Edit the Fragment

The fragment opens in the **page editor** (same as editing a page). Add components from the left sidebar (drag & drop or tap the + button). Common components used: Text, Image, Teaser, Button, Container.

Step 5 — Save and Publish

Click **Page properties** → **Publish** or use **Quick Publish**. Alternatively, go back to the console, select the fragment → **Manage Publication**.

Using the Fragment on a Page

1. Open any page in the editor.
2. Add the **Experience Fragment** component to a layout container.
3. Click **Configure** (wrench icon).
4. Browse and select your fragment.
5. Choose the variation if multiple exist.

AEM 6.5 Specific Notes

- Templates are managed under **Tools** → **General** → **Templates** → **your site folder**.
- Fragments are stored at **/content/experience-fragments/**.
- AEM 6.5 supports exporting XFs to Adobe Target via **Tools** → **Cloud Services** → **Adobe Target**.
- You can convert a fragment variation to an **HTML offer** or **JSON offer** for Target.
- **Building Blocks** feature is available — lets you promote part of a fragment as a reusable block.
