

Insert Employee details using JDBC

Write a program to insert the employee details to the database using JDBC.

Perform the following instructions:

1. Create payroll schema with table employee using the below scripts:

```
CREATE DATABASE payroll;
USE payroll;
CREATE TABLE employee (
    employee_id    int AUTO_INCREMENT,
    name           varchar(255),
    date_of_birth  date,
    salary         int,
    PRIMARY KEY (employee_id));
```

2. Create Employee class with attributes listed below. Include appropriate constructor and getter / setter methods.
 - employeeId
 - name
 - dateOfBirth
 - salary
4. Create EmployeeDAO to handle all the database related functions.
 - Include a method getConnection() to get the connection details and connect to the database.
 - Include a method addEmployee(Employee employee) to connect to the database and insert employee details to the database using prepared statement. Read the values from employee and bind the parameters.
3. Create a class EmployeeService
 - Implement method addEmployee(employee), which creates an instance of EmployeeDAO class and invokes the addEmployee() method to save the data.

4. Create a class named Main and implement the following steps in main method:
 - Read the detail for one employee from the console and set it in a new instance of Employee.
 - Create an instance of EmployeeService and invoke addEmployee() method passing the employee instance created in the previous step.

NOTE: Code submission not required. To be implemented using eclipse IDE and manually verified by the SME.

Sample Input and Output:

Enter the Employee details

Enter the ID:

969143

Enter the Name:

John

Enter the Date of birth (dd/MM/yyyy):

08/07/1987

Enter the Salary:

120000

The Given data is successfully inserted to the database.
