

Display Employee details using JDBC

Write a program to display the list of employees from the database using JDBC.

Perform the following instructions:

1. Modify class EmployeeDAO that was implemented as part for the previous problem.
 - Include a method getAllEmployees() which returns the ArrayList of employee objects.
 - Set each row retrieved from the database to a new employee instance and add it to the employeeList and return the same
2. Modify class EmployeeService to include a new method getAllEmployees() that invokes the respective method DAO class and returns the same.
3. Modify the existing main method Main class so that after insert of employee details, let is display all the rows from the database by invoking the getAllEmployees() method of EmployeeService. Use lambda expression to display the list of employees.

Refer sample output for formatting specifications.

Sample Output:

Enter the Employee details

Enter the ID:

969143

Enter the Name:

John

Enter the Date of birth (dd/MM/yyyy):

08/07/1987

Enter the Salary:

120000

Employee details inserted successfully. Refer employee list below.

John 08/07/1987 120000

Priya 24/08/1987 140000

Divya 14/08/1987 160000
